Associate Professor, Department of Mechanical Engineering, Bharati Vidyapeeth, Kolhapur, Maharashtra, India⁴

ABSTRACT: In India, Corn is one of the most important crop and it has a source of a large number of industrial products besides its use as human food and animal feed. Every part of Corn has economic value as the grain, leaves, main crop stalk, tassel and cob can all be used to produce a large variety of food and non-food products. After harvesting with sickle and plucking of cob manually, dehusking of cob is done by hand to remove its outer sheath and further grain is obtained by shelling the cob traditionally, i.e. by beating the dehusked cobs with sticks or with fingers or sickle, etc. To overcome this problem of removing its outer sheath and dehusking the cobs this machine was developed. The machine basically compromises of separate shelling chamber, threshing chamber, collecting tray and motor (2HP). The arrangement of these parts is connected by belt and pulley mechanism. The weight was only 95 Kg. After testing the machine, the production rate for threshing operation was 300 kg/hr and for shelling 300 kg/hr. At last the germination test was carried out for corn seeds threshed by the machine and it were found that time required to grow from seed was about 48 hours.

KEYWORDS: Corn, shelling machine, threshing machine, design methodology, production rate, germination test, fabrication.

I. INTRODUCTION

In India, most of the farmers shell corn by mainly three methods namely shelling cob grain by hand; hand operated corn Sheller and beating by stick method were carried for removing corn kernel from the cob.For removal of corn shells and to deseeding of the corns with minimum damage to the corns, people uses various methods out of those two methods are described below:

I.I. Manual shelling and threshing:
In many regions of the India corn shelling and threshing is done manually, this method is conventional but productivity and output from that method is low and that’s why there is a need to switch to mechanical motorised system for corn shelling and threshing.

I.II. Mechanical shelling and threshing:
Mechanical motorised corn sheller andresher gives more desirable results than manual conventional method of corn shelling and threshing. It tends to saving of the time and also leads to save money. It is desirable to use low cost corn sheller and threshers for economical work and to increase the productivity.

Along with this there are several electrical operated Corn shelling machines for mass shelling. Mostly farmers used to take their unshelled Corns to such industries were they get their final product that is shelled Corn and then they used to sell this product to the market. This incurred the cost of transportation between farms to machine industry increase the cost of product.

This research aimed at developing a portable, low cost, locally fabricated machine which can easily maintained by the peasant farmers. Also the machine can perform both shelling and threshing operations simultaneously.

II. OBJECTIVES

1. Motor selection - to choose proper electric motor for this application based on torque speed and power.
2. To reduce the power using belt drive and pulley system to form uniform shelling and threshing operation.
3. To construct a structure to fit all accessories to it with proper moving attachments.
4. Design of shelling shaft.
5. Retraction of shells from corn hubs.
6. To design threshing shaft.
7. To design separation zone for corn shells and seeds.

III. METHODOLOGY AND PROPOSED WORK

1. To construct working drawing of assembly by computer aided design procedure.
2. To select optimum motion for threshing and shelling operation.
3. To design a frame to sustain all these accessories and all loads developed by it.
4. To design shaft for shelling operation to run shelling operation smoothly.
5. To design belt drive and pulley system for threshing and shelling operation/
6. Design of shaft for threshing operation.
7. To perform test on corn having different moisture contain from 20% to 75%.
8. To analyse results test conducted different moisture content and modification.
9. Analysis of results obtained.

IV. DESIGN FOR COMPONENTS OF CORN SHELLING AND THRESHING MACHINE

IV.1 Belt, Pulley and Shaft Design for Shelling Operation:
A solid Shaft made up of mild steel 40C8 having yield strength as 380 Mpa was choose. This shaft was coupled to electric motor rotating at 1440 rpm. The following design parameters are:
1. Permissible Shear Stress (\( \tau \)):-
   When the external force acting on the component tend to slide the adjacent planes with respect to each other, the resulting stresses in these planes are called shear stress.
   \( \tau = \frac{S_y}{F.S.} = 0.5 \times \frac{(S_y)}{F.S.} = 0.5 \times 380 / 1.5 = 126.66 \text{ N/mm}^2 \).
2. Torsional Moment (\( M_t \)) :-
   \( M_t = 60 \times 10^6 \text{ (KW)} / 2\pi \times 1.492 / 2\pi(710) = 20066.97 \text{ N-mm} \).
3. Bending Moment:
For Pulley (1),\( D = 130 \).

Calculation of \( P_1 \) and \( P_2 \).

\[
\begin{align*}
M_t &= (P_1 - P_2) \times (D/2). \\
20066.97 &= (P_1 - P_2) \times 65. \\
(P_1 - P_2) &= 308.72. \quad \text{...................(1)}
\end{align*}
\]

\[
\begin{align*}
P_1/P_2 &= e^{0.3x} = 2.566. \quad \text{..................(a)}
\end{align*}
\]

\[
P_1 = 2.566 \times P_2. \quad \text{..................(b)}
\]

Put value (b) into equation (1).

\[
P_1 = 2.566P_2 \quad \text{and} \quad P_2 = 197.14\text{N} \quad \text{..................(c)}
\]

From equation (b) and (c).

\[
P_1 = 2.566 \times 197.14 = 505.86 \text{ N}
\]

Let, \( R_1 + R_2 = 703 \) \quad \text{..................(d)}

Taking moment at \( R_1 \),

\[
\begin{align*}
R_2 \times 800 &= 703 \times 1000 \\
\therefore R_2 &= 878.75 \text{ N}
\end{align*}
\]

Now, bending moment is given by,

\[
M_b = (785.5 \times 200) + (175.75 \times 1000) = 351.45 \text{ N-m}
\]

4. Shaft Diameter On Strength Basis:

Transmission shafts are subjected to axial tensile force, bending moment or torsional moment or their combinations. Most of the transmission shafts are subjected to combined bending and torsional moments.

We know,

\[
d^3 = \left\{ \frac{16}{(\tau \times \pi)} \right\} \times \left( \frac{M_b^2 + T_2^2}{0.5} \right) = \left\{ \frac{16}{(126.66 \times \pi)} \right\} \times \left( \frac{351450^2 + 15830^2}{0.5} \right)
\]

\[
d = 24.18 \approx 25 \text{ mm}
\]

- Length of belt :-

\[
L = 2C + \frac{\pi}{4} \left\{ \frac{D + d}{2} \right\} + \frac{(D - d)}{4}
\]

\[
= 2 \times 600 + \frac{\pi}{4} \left( \frac{130 + 63}{2} \right) + \frac{130 - 63}{4} \\
\therefore L = 1505.03 \text{ mm}
\]

\[
\text{from std. table,} \quad L = 1600 \text{ mm}
\]

- Corrected centre distance:-

\[
L = 2C + \frac{\pi}{4} \left\{ \frac{D + d}{2} \right\} + \frac{(D - d)}{4}
\]

\[
\therefore 1600 = 2C + \frac{\pi}{4} \left\{ \frac{130 + 63}{2} \right\} + \frac{130 - 63}{4} \\
\therefore C = 645.5 \text{ mm}
\]

IV.II BELT, PULLEY AND SHAFT DESIGN FOR THRESHING OPERATION

Speed (\( N \)) = 600 rpm, \( P = 0.746 \text{ KW}, S_{nt} = 380\text{N/mm}^2, \theta = \text{Angle of wrap}, P_1/P_2 = e^{0.3x}, P_1/P_2 = 2.566

1. Permissible Shear Stress (\( \tau \)) :-

\[
\]
\[
\tau = 0.5 \left( S_{yt} \right) / F.S = 0.5 \left( 380 \right) / 1.5 = 126.66 \text{ N/mm}^2
\]

2. Torsional Moment (M_t):
\[
M_t = 60 \times 10^6 \text{ (KW)} / 2\pi N = 60 \times 10^6 \left( 1.492 \right) / 2\pi (600) = 23745.92 \text{ N-mm.}
\]

3. Bending Moment:
For Pulley, D = 125mm.
Calculation of P1 and P2.
\[
\begin{align*}
M_t &= (P_1 - P_2) \times (D / 2). \\
18996 &= (P_1 - P_2) \times 62.5 \\
(P_1 - P_2) &= 305.936 \\
P_1 / P_2 &= e^{0.24\pi}.
\end{align*}
\]

Put value (b) into equation (1).
\[
2.125P_2 - P_2 = 368.15
\]
\[
P_2 = 194.08 \text{ N} \\
P_1 = 2.566 \times P_2
\]

From equation (b) and (c).
\[
P_1 = 2.566 \times 194.08 \\
P_1 = 498.02 \text{ N}
\]

Let,
\[
R_1 + R_2 = 692.1
\]
Now, bending moment is given by,
\[
M_b = (814.23 \times 150) + (122.13 \times 1000) = 244.264 \text{ N-m}
\]

4. Shaft Diameter On Strength Basis:
\[
\begin{align*}
d^* &= \left[ \left\{ \left[ 16 / (\tau \pi) \right] \times (M_t^2 + T_2^2)^{0.5} \right\} \times \left( 244264.5^2 + 18996^2 \right)^{0.5} \right] \\
d &= 21.44 \approx 25 \text{ mm.}
\end{align*}
\]

- Length of belt :-
\[
L = 2C + \frac{\pi}{2} \left( D + d \right) + \frac{( D - d )}{4 C}
\]
\[
\therefore L = 1297.23 \text{ m m}
\]

- Corrected centre distance (C):-
IV.III Bearing Selection:

Bearing must be selected based on its load carrying capacity, life expectancy and reliability (PSG Tech 1989). The relationship between the basic rating life, the basic dynamic rating and the bearing load is:

\[ L = \frac{C}{P} \frac{(D + d)}{2} + \frac{(D - d)}{4C} \]

\[ 1250 = \frac{C}{P} \frac{(125 + 63)}{2} + \frac{(125 - 63)}{4C} \]

\[ \therefore C = 476 \text{ mm} \]

From calculations select standard bearing for 25 mm diameter shaft is 6205.

V. ASSEMBLY OF MACHINE

VI. TESTING OF CORN SHELLING AND THRESHING MACHINE

1. Time required to Shelling and threshing of 100kg maize is 20minutes.
2. The average shelling and threshing capacity of machine is 300 kg/hrs.
3. Machine can remain in working position as long as electricity gets supplied to motor.
4. Shelling and threshing efficiency of this machine is 90%
5. As load increases, speed decreases.

<table>
<thead>
<tr>
<th>Load</th>
<th>Speed</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 kg</td>
<td>600rpm</td>
</tr>
<tr>
<td>10 kg</td>
<td>560rpm</td>
</tr>
</tbody>
</table>

VII. CONCLUSION

1) Corn shelling and threshing machine adds modernization in the agricultural field. This machine will make the farmers becomes independent and not rely on the labours for removing covers of maize and for deseeding.
2) A single person can efficiently operate this Corn shelling and threshing machine.
3) It takes less weeding time compared to manual shelling and threshing of maize.
4) Controlled feed rate and from working as per directions on can achieve greater productivity.
5) It is portable Corn shelling and threshing machine with collecting system which can be driven by automatically.
6) Production rate

7) Germination test: Germination is the process by which a plant grows from seed. Several factors influence if, and how, seed germinate. The most important factors are water availability, temperature, and sunlight. The seed must go through imbibitions to activate root growth.
