ABSTRACT: Traditionally, in paper based election, voters cast their vote to select right candidate, where they simply put their vote in voting box and at the end of the voting day the votes are going to be count manually. This process was much time consuming as well as was erroneous. To overcome this drawback Electronic Voting Machine (EVM) was introduced. In EVM, Voter cast their vote by pressing the voting button which was on EVM. The Major advantage of EVM system is , the votes are counted automatically instead of manually. But the drawback of EVM machine was, the votes may get manipulated and was not secure. So to overcome all these drawbacks, research on biometric based voting system is going on. This Paper focuses on survey of different voting system using Fingerprint biometric through different algorithms and methods.

KEYWORDS: Electronic Voting Machine (EVM), fingerprint scanner, E-voting, security.

I. INTRODUCTION

The field of biometrics was formed and has expanded on to many types of physical identification. Still, the human fingerprint remains a common identifier and the biometric method of choice among law enforcement. These concepts of human identification have led to the development of fingerprint scanners that serve to quickly identify individuals and assign access privileges. The basic work of these devices is also to examine the fingerprint data of an individual and compare it to a database of other fingerprints. Everyone in the world is born with a fingerprint that is unique; a distinct and comprehensively identifying attribute that sets us apart from the other 6.5 billon people that inhabit this world, because of this fact that the fingerprint has proven such a useful part of biometric security. The very reason that fingerprint scanners are useful can be found in this fact as well. However, this is far from the only reason they are used. Refer fig 1 for Biometric system data flow, as system takes input from user and checks the input with stored template from database for validation. If valid then it will allow access otherwise, it will deny access.

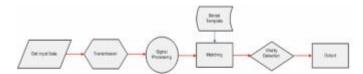

Figure 1 - Biometric System data flow

The integration of biometric with EVM undoubtedly requires less manpower, save much time of voters and personnel eliminate rigging, ensure accuracy, gives transparency and fast results in election. But drawback of this is, voter cannot cast their vote from remote locations.

II. LITERATURE SURVEY

Naturally calls for a fully automated online computerized election process. In addition to overcoming commonly encountered election pitfalls, electoral vote counts are done in real time that by the end of elections day, the results are automatically out [1, 2]. An architecture in which voting is done by making use of cards, this cards are designed similar to smart cards which have all details related to the voter embedded in them, hence it ensures assurability, security, verifiability and transparency into voting system[3].Clash Attacks i.e. voting machine sometimes provide same receipts to the different voters because of this election gets manipulated[4][6].A framework for electronic voting machine based on biometric verification was proposed and implemented.The proposed framework ensures secured identification and authentication processes for the voters and candidates through the use of fingerprint biometrics [5].

A computer system whose main element is an software component that maps the voting operation electronically is called an e-voting system. A direct recording electronic(DRE) machine is a special case of such a system as it implements all steps in the voting . process, from registration and ballot casting to counting. Security is a fundamental criterion for the selection and use of electronically supported election systems. To provide and assure security in e-voting systems, an integral approach that covers all parts of this complex system should be chosen. This method is also called *holisticsecurity* [7].

Design of a Distributed e-Voting system which ensures the voter confidentiality and voting accuracy using Ballot Distribution Committee responsible for distributing ballots. The proposed E-voting system, referred to as Enhanced NOTE (E-NOTE), is enhanced with a advanced protocol design and watchdog hardware device to ensure voter confidentiality and voting accuracy [8].

By using the Smart Card Web Server (SCWS) on a mobile phone Subscriber Identity Module (SIM) which will improves the authentication and helps the voter to easily vote from remote location. Remote e-voting via the Internet provides the convenience of voting on the voter's personal computer or mobile device, but Internet voting systems are vulnerable to many common attacks, affecting the integrity of an election [9].

Design of a secured E voting system using RFID tag as security so one can easily vote from anywhere to anyone .E-voting systems are becoming popular with the widespread use of computer and embedded systems. Security is the important issue should be considered in such systems[10].

III. PERFORMANCE REVIEW TABLE

Pp No	Paper Titles	Techniques	Parameters Achieved
•			
1.	A Biometric-Secure	Biometric authentication	Correctness, robustness, coherence, consistency,
	e-Voting System for		security
	Election		
	Processes		
2.	Design of a Secured	homomorphic property	Eligibility, Uniqueness, Privacy, Integrity,
	E-voting System	and blind signature.RFID.	Accuracy.
3.	Biometric Secured	Fingerprint based	Security, Time and Cost efficiency.
	Mobile Voting	biometric control	
		information and	
		encryption along with	
		SSL using VeriSign.	
4.	Implementation of	Universal Identification	Cost effectiveness, non-traceability, Integrity,
	Authenticated and	Number, Secret Voting	security.
	Secure Online	Password andBiometric	
	Voting System	identification.	
5.	TRUSTED	secure study of electronic	Classes of Attacks, injecting Attack Codec,
	SECURE	voting	Difficulty of Recovery.

	ELECTRONIC VOTING MACHINE	Machine.	
6.	DESIGN A SECURE ELECTRONIC VOTING SYSTEM USING FINGERPRINT TECHNIQUE	Fingerprint identification.	Accuracy, transparency, security, fast results.
7.	E-Voting system security optimization.	Holistic security, EVSSO Method	Secrecy of vote, publicity, transparency
8.	Distributed e-Voting using the Smart Card Web Server	Smart Card Web Server (SCWS) and mobile phone Subscriber Identity Module (SIM).	Distributed architecture, security
9.	E-NOTE: An E-voting System That Ensures Voter Confidentiality and Voting Accuracy	New protocol Design and watchdog hardware.	Reliability of software, confidentiality, voting accuracy.
10	SECURE E- VOTING SYSTEM WITH BIOMETRIC AND WAVELET BASED WATERMARKIN G TECHNIQUE IN YCgCb COLOR SPACE	Biometric and Wavelet based watermarking technique in YCgCb color space.	Mobility, privacy, security.

IV. CONCLUSION

The system is design based on latest technology is smart voting system using fingerprint recognition. Smart voting system is useful for voter because voter can cast vote from any city to their constituency. Smart voting system may become rapid, boosted and efficient way to administration election. It also simplify counting of votes and requires minimum number of officers. Result are quickly transferred to centralized database.
